Some reagents required for tests shown in this booklet are classed as hazardous and as such, a minimum protection of gloves (rubber or plastic) and safety goggles/spectacles or facemask **MUST BE WORN**.

In addition please note and observe the Risk and Safety phrases on each reagent container and follow handling guidelines as instructed.

GENERAL NOTES

- ⇒ Avoid contact with skin or eyes
- ⇒ In case of contact with skin or eyes rinse immediately with plenty of running tap water, and seek medical attention
- ⇒ Seek attention if irritation persists
- ⇒ In case of ingestion, wash the mouth out thoroughly with water, try to vomit and seek medical attention

P-Alkalinity

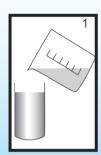

1. Take 20 ml of cold coolingwater sample with the 20 ml syringe. Spray the 20 ml in the clean test jar.

2. Add 4 drops of Reagent PA1. The sample will turn pink. In case the sample does not colour pink, the reading is zero.

- 3. Add drop by drop Reagent PA2, until the sample decolours. Count the numbers of drops used.
- 4. Each drop is equivalent to 40 mg/l or ppm P-Alkalinity expressed as CaCO₃
- 5. Retain the sample after the alkalinity test, as this sample can be used for the Chloride test.

Drops of PA2 Reagent	P-Alkalinity as mg/I CaCO ₃	
1	40	
2	80	
3	120	
4	160	
5	200	
6	240	
7	280	
8	320	
9	360	
10	400	

Notes:

Low P-Alkalinity, increase product dosage to achieve 200 mg/l P-Alkalinity

Correct P-Alkalinity

Chloride Test

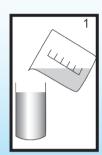

1. Take the sample that is first used for the P-alkalinity test.

2. Add 12 drops of Reagent BC1. The sample will turn orange /yellow.

- 3. Add drop by drop Reagent BC2, until a **turbid** dark orange to brown colour appears. Count the numbers of drops used.
- 4. Each drop is equivalent to 20 mg/l or ppm Chlorides

20 400	19	380	
	20	400	

Notes:

Maximum Chloride levels:

Medium pressure boilers : 100 mg/l

: 300 mg/l

In case the chloride level is too high, reduce the amount of chlorides by blowdown.

⇒ 1 mg/l is 1 ppm

Condensate pH Test (1,0 - 14,0)

- 1. Take 50 ml of cold coolingwater sample in the clean test jar.
- 2. Dip test strip for 1 second in the sample.
- 3. Shake off excess sample solution.
- 4. Compare with colour scale and read off the corresponding pH value.

pH value			
<7,0	Carrasius		
7,5	Corrosive	See fault finding	
8,0	Clightly corrective	chart	
8,5	Slightly corrosive		
9,0			
9,5	Non corrosive	Well treated	
10,0			
10,5			
11,0	Corrosive on Cop-		
11,5	per		
12,0		See fault finding	
12,5		chart	
13,0	Corrosive on Cop-		
13,5	per and Iron		
14,0			

1			
Fault Finding Chart	Cause(s)	Solution(s)	
Chlorides below 20	Boiler newly filled with deminer- alized or evaporated water	Boiler water has to concentrate, days	will take several
ppm	High blowdown	Check blowdown valves for leak	ages
	Low quality feed water	Only use demineralized or evap	orated water
Chlorides far too high		Check evaporator	
	Sea cooling water leakage	Search for leakages, for exampl	e at the condenser
P-Alkalinity too low	Boiler newly filled with deminer- alized or evaporated water	Boiler water has to concentrate, days	will take several
	Low Caretreat 3 Boiler dosage	Check dosing pump / increase	dosage
P-Alkalinity too high	Low quality feed water	Only use demineralized or evap	orated water
		Do NOT use shore water	
	High Caretreat 3 Boiler dosage	Check dosing pump / decrease dosage	
	Low blowdown	Increase blowdown, check for b	locked blowdown

InH Condensate too low	Low hotwell temperature	Increase hotwell temperature to 80°C	
	Low Caretreat 4 Boiler dosage	Check dosing pump / increase	dosage
pH condensate too high		see: chlorides far too high	
	P-Alkalinity too high	see: P-Alkalinity too high	
	Carry over, causing wet steam	Increase blowdown, check for valves	blocked blowdown

Reagent PA2	1	

- ⇒ Read the boilers manual regarding the boilerwater systems treatment
- ⇒ Contact us for advise
- ⇒ E-mail us all test figures over a period of at least 3 months
- ⇒ Send us a Boilerwater and Feedwater sample
 - ⇒ Take a sample in a clean bottle at least 0,5 liter per sample Fill the bottle(s) to the top
